

DanScribe AI

Professional Edition

Release Notes — Version 2.0

Release: March 2026 | Platform: Windows 10/11 | Powered by OpenAI Whisper + Claude AI

About DanScribe AI

DanScribe AI is a South African desktop transcription application that converts audio recordings into accurate text using OpenAI's Whisper AI engine. Version 2.0 adds speaker identification, AI-powered meeting summaries via Anthropic Claude, and professional Word document output. Built in South Africa, for South Africans.

What's New in Version 2.0

Speaker Identification

- Automatically detects and labels different speakers in a recording.
- User sets the expected number of speakers (2–8) before processing.
- Uses dynamic pause-threshold analysis — no internet or external model required.
- Speaker labels appear as Speaker 1, Speaker 2, etc. in the transcript.

Assign Speaker Names

- After transcription, click 'Assign Speaker Names' to replace labels with real names.
- Names are applied to both the transcript display and the saved output files.
- Names carry through to the AI summary, producing professional minutes.

AI Summary via Claude

- One-click meeting summary powered by Anthropic Claude AI.
- Extracts main discussion points, decisions made, and action items.
- Summary is written in the same language as the transcript.
- Requires a personal Claude API key (free to obtain at console.anthropic.com).

Word Document Output (.docx)

- All transcriptions and summaries are now saved as both .txt and .docx files.
- Word documents include formatted headings, speaker labels in bold, and a date stamp.
- No additional software required — uses python-docx internally.

Settings Window

- New dedicated Settings window (gear icon, top-right).

- Claude API key entered and stored securely in a local config file.
- Clickable link to console.anthropic.com for easy key retrieval.

UI & Usability Improvements

- Full English interface throughout.
- South African flag displayed in the header — Made in South Africa branding.
- 'Translate to English' is now the default task selection.
- Model caching — model loads once per session, not on every transcription.
- Last used model and language are remembered between sessions.
- Timestamps added to all output filenames to prevent overwrites.

Extended File Format Support

- Added support for .webm in addition to existing .mp3 .wav .m4a .flac .ogg .mp4

Previous Versions

Version 1.3.0

- Added language selection for all 11 official South African languages.
- Added AI model selection (Base, Small, Medium).
- Fixed thread-safety issues causing UI crashes.
- Added .ogg and .mp4 format support.

Version 1.2.0

- Introduced model selection (tiny, base, small, medium).
- Added model caching to improve speed on repeat use.

Version 1.1.0

- Added translation mode — transcribe audio directly to English.
- Progress bar and status label added to interface.

Version 1.0.0

- Initial release with basic Whisper transcription and dark-mode UI.

Known Limitations

- Speaker identification uses pause analysis — rapid back-and-forth conversation may reduce accuracy.
- Afrikaans accuracy is best with the Medium model; smaller models may return Dutch text.
- Very long recordings (60+ minutes) may take several minutes to process.
- First use of each model requires an internet connection to download.
- Claude AI summary requires an active internet connection and a valid API key.

System Requirements

Requirement	Details
Operating System	Windows 10 or later (64-bit)
RAM	4 GB minimum — 8 GB recommended for Medium model
Disk Space	150 MB (Base) up to 1.5 GB (Medium)
Internet	Required on first run per model; required for Claude AI summary
Python	3.9 or higher (source only — not needed for .exe)

Supported Audio Formats

Format	Description
.mp3	MPEG Audio Layer III
.wav	Waveform Audio
.m4a	MPEG-4 Audio
.flac	Free Lossless Audio Codec
.ogg	Ogg Vorbis
.mp4	MPEG-4 Video (audio extracted)
.webm	WebM Audio/Video
